

Research Summary

Rune Factory 4 Special / Rune Factory 5

Purpose

This document is a concise orientation to the inheritance-research collection. It records the current state of observed mechanics rather than claiming to be a complete strategy guide.

Research Origin

The work began during an RF5 villager-equipment project covering more than 25 characters, including equipment composition, inheritance structure, appearance preservation, and AI behavior. Boundary conditions and undocumented inheritance behavior led to dedicated testing.

Main Topics

- performance inheritance
- arrange inheritance
- auto-arrange
- recursive processing
- Messhilite inheritance
- candidate-count and success-probability models

Hypothesis Boundary

Confirmed observations, strong observation-based inferences, and unverified hypotheses coexist in the source material. Recursive depth, selection order, candidate weighting, and RF4SP/RF5 differences include areas with insufficient observations or untested boundaries.

Version Dependence

Behavior is not assumed to be identical across RF4, RF4 Special, RF5, Switch, Steam, or different update versions. The primary observation environments were RF4 Special on Switch and RF5 primarily on Steam.

Observation Limitations

- some exact version numbers were not recorded

- some observations were single occurrences
- some screenshots were not preserved

Where reproduction is possible, the collection aims to state the conditions, procedure, and observed result.
